

Scenario

You're an experienced Business Analyst at a big hotel chain. The company just bought a new hotel, but its room booking databases are old-fashioned and require manual handling.

Your task is to create a UML Conceptual Class Diagram for discussing business needs with the integration team. This diagram doesn't delve into the nitty-gritty details of how the system operates. Instead, it provides a big-picture view, allowing you and the team to explore what's required conceptually. Later on, this diagram will guide the technical team in building the final system.
